

Public net electricity generation in Germany in the First Half of 2026

Leonhard Gandhi
Freiburg, 01.07.2026
Update: 29.07.2026
www.ise.fraunhofer.de

Net Electricity Generation in the First Half of 2026

Solar Power Is on the Rise Across Europe

In the first half of 2026, more solar power was fed into the grid in Germany and many other European countries than ever before. Electricity generation from onshore wind increased compared to the first half of 2025, but did not set a new record. Offshore wind, however, did set a new record. The share of renewable electricity in the load—that is, in electricity consumption from the grid and grid losses—reached a new record of 58.5 percent. Within the European Union, grid feed-in from solar and wind rose from 362 terawatt-hours (TWh) in the first half of 2025 to 397 TWh in the first half of 2026. This is evident from the half-year data on public net electricity generation presented today by the Fraunhofer Institute for Solar Energy Systems ISE. The analysis is based on the data platform energy-charts.info.

Wind Energy was once again by far the largest source of electricity in Germany, generating 67.4 terawatt-hours (TWh) compared to 60.1 TWh in the first half of 2025. Its share of electricity consumption (load) stood at 28.4 percent. »That's about 2.6 percentage points more than in 2025, mainly because installed capacity has increased,« comments Leonhard Gandhi, senior researcher at Energy-Charts at Fraunhofer ISE. »Despite the increase compared to 2025, the 2024 level was not reached.«

Photovoltaic Systems fed 43.2 TWh into the grid, accounting for 18.2 percent of electricity consumption (load) (1st half of 2025: 39.3 TWh; 16.9%). Grid feed-in from photovoltaic systems also continued to rise in many other European countries: In France, solar power plants contributed 17.4 TWh of electricity (first half of 2025: 15.1 TWh); Belgium reached 6.1 TWh (first half of 2025: 5.6 TWh); Denmark reached 2.8 TWh (first half of 2025: 2.3 TWh); and Poland increased its solar power feed-in from 10.3 TWh in the first half of 2025 to 12.2 TWh in the first half of 2026.

Net Electricity Generation in the First Half of 2026

Solar Power Is on the Rise Across Europe

Load or Electricity Consumption from the Grid

In the first half of 2026, the load (= electricity consumption from the grid + grid losses) totaled 237 TWh. This represents an increase of about two to three percent compared to the last three first halves of the year.

Import and Export

In the first half of 2026, a net total of 1.3 TWh of electricity was imported (first half of 2025: net imports of 9.6 TWh). Electricity imports came from Scandinavia (Denmark, Sweden, and Norway), France, Belgium, and the Netherlands. Electricity was exported to Austria, the Czech Republic, Luxembourg, Poland, and Switzerland.

Prices Stable

Volume-weighted electricity exchange prices rose slightly: from 86.64 euros/MWh in the first half of 2025 (day-ahead auction, volume-weighted) to an average price of 93.70 euros/MWh in the first half of 2026. Monthly volume-weighted electricity exchange prices were high, particularly in January and February, due to low wind power generation. Starting in March, the effects of the war in Iran also became apparent, preventing prices from falling as they typically do in the spring.

Electricity prices for new customers in Germany fell back to the January 2021 level in June 2026, averaging 24 cents per kilowatt-hour. The price of natural gas in the first half of 2026 was slightly higher than in the first half of 2025.

Agenda

- 1. Net Public Electricity Generation in Germany in the First Half of the Year**
- 2. Net Public Electricity Generation in Europe in the First Half of the Year**

Net Public Electricity Generation

First half of 2026

Energy-Charts.info - last update: 02.07.2026, 07:31 MESZ

https://www.energy-charts.info/charts/energy/chart.html?l=en&c=DE&interval=halfyear&stacking=stacked_grouped&legendItems=1x7vru&sum=1&halfyear=1&year=2026

Net Public Electricity Generation

First half of 2026

The chart shows net electricity generation from power plants for the public electricity grid. This is the actual electricity mix that comes out of the outlet. Electricity generated by power plants for “manufacturing, mining, and quarrying operations”—that is, industrial generation for on-site consumption—is not included in this chart.

<https://www.energy-charts.info/charts/energy/chart.html?l=en&c=DE&chartColumnSorting=default&interval=halfyear&stacking=single&partsum=1&legendItems=2x1t0e&year=2026&halfyear=1>

Absolute Change in Net Public Electricity Generation

First half of 2026 compared with the first half of 2025
